How to Design a Neighbor

Edit

New Page

Michael Ossmann edited this page on Oct 18, 2015 · 7 revisions

This guide will help you design a neighbor, an add-on board for GreatFET.

Use the Template

The easiest way to get started is to copy neighbor-template from the repository and use KiCad to edit the design. The template is a four layer PCB, so you may want to delete the inner two layers under Layer Setup to make a two layer neighbor.

Required Elements

Every neighbor should connect to both of the two 2x20 pin headers (J1 and J2) on GreatFET. You can use female stackable headers mounted on the top of your neighbor, or you can use male headers mounted on the bottom if you do not want your neighbor to be stackable. For mechanical stability, use 2x20 headers (not headers with fewer pins) even if you don't need to use very many pins. (TODO: stackable header component recommendations)

You may power your neighbor from the 3.3 V supply (VCC) provided by the GreatFET, but you may only draw 150 mA from this supply. If you need more current or a different voltage, use VBUS (the 5 V power supply from the USB host) and implement your own voltage regulation.

Bonus Row

The bonus row of pins (J7) is not required. Design your neighbor without the bonus row if you can
